

Parsimony

Genome 559: Introduction to Statistical and
Computational Genomics

Elhanan Borenstein

Who am I?

- Faculty at Genome Sciences
- Computational systems biologist
- Training: CS, physics, hi-tech, biology
- Research interests: Complex biological networks | Evolutionary dynamics | Microbial communities and metagenomics

What will change?

- **Not much!**
- **Informatics:** From sequence to genes and to systems
- **Programming:**
 - More emphasis on design and coding practices
 - Tip of the day
 - Coding style
- Website: http://elbo.gs.washington.edu/courses/GS_559_12_wi/

A quick review

■ Trees:

- Represent sequence relationships
- A sequence tree has a topology and branch lengths (distances)
- The number of tree topologies grows very fast!

■ Distance trees

- Compute pairwise corrected distances
- Build tree by sequential clustering algorithm (UPGMA or Neighbor-Joining).
- These algorithms don't consider all tree topologies, so they are very fast, even for large trees.

“Maximum Parsimony Algorithm”

A fundamentally different method:

Instead of reconstructing a tree,
we will search for the best tree.

“Pluralitas non est ponenda sine necessitate”

(Maximum) Parsimony Principle

- *“Pluralitas non est ponenda sine necessitate”*
(plurality should not be posited without necessity)
William of Ockham
- Occam’s Razor: Of two equivalent theories or explanations, all other things being equal, the simpler one is to be preferred.

William of Ockham
(c. 1288 – c. 1348)

- "when you hear hoof beats, think horses, not zebras"
Medical diagnosis
- The KISS principle: "Keep It Simple, Stupid!"
Kelly Johnson, Engineer
- “Make everything as simple as possible, but not simpler”
Albert Einstein

Parsimony principle for phylogenetic trees

*Find the tree that requires the
fewest evolutionary changes!*

Consider 4 species

human
chimp
gorilla
orangutan

Consider 4 species

Sequence data:

	<u>123456</u>
human	agtctc
chimp	agagtc
gorilla	cggcag
orangutan	cgggac

positions in alignment
(usually called "sites")

- The same approach would work for any discrete property that can be associated with the various species:
 - Gene content (presence/absence of each gene)
 - Morphological features (e.g., "has wings", purple or white flowers)
 - Numerical features (e.g., number of bristles)

Consider 4 species

Sequence data:

	1	2	3	4	5	6
human	a	g	t	c	t	c
chimp	a	g	a	g	t	c
gorilla	c	g	g	c	a	g
orangutan	c	g	g	a	c	

positions in alignment
(usually called "sites")

Parsimony Algorithm

- 1) *Construct all possible trees*
- 2) ***For each site in the alignment and for each tree** count the minimal number of changes required*
- 3) *Add all sites up to obtain the total number of changes for each tree*
- 4) *Pick the tree with the lowest score*

Consider 4 species

Sequence data:

	123456
human	agtctc
chimp	agagtc
gorilla	cggcag
orangutan	cgggac

All possible unrooted trees:

Consider site 1

	1	2	3	4	5	6
human	a	g	t	c	t	c
chimp	a	g	a	g	t	c
gorilla	c	g	g	c	a	g
orangutan	c	g	g	g	a	c

What is the minimal number of evolutionary changes that can account for the observed pattern?

(Note: This is the “small parsimony” problem)

Consider site 1

	1	2	3	4	5	6
human	a	g	t	c	t	c
chimp	a	g	a	g	t	c
gorilla	c	g	g	c	a	g
orangutan	c	g	g	g	a	c

What is the minimal number of evolutionary changes that can account for the observed pattern?

(Note: This is the “small parsimony” problem)

Consider site 1

	1	2	3	4	5	6
human	a	g	t	c	t	c
chimp	a	g	a	g	t	c
gorilla	c	g	g	c	a	g
orangutan	c	g	g	g	a	c

Consider site 1

	1	2	3	4	5	6
human	a	g	t	c	t	c
chimp	a	g	a	g	t	c
gorilla	c	g	g	c	a	g
orangutan	c	g	g	g	a	c

Consider site 2

	1	2	3	4	5	6
human	a	g	t	c	t	c
chimp	a	g	a	g	t	c
gorilla	c	g	g	c	a	g
orangutan	c	g	g	g	a	c

Uninformative
(no changes)

Consider site 3

	1	2	3	4	5	6
human	a	g	t	c	t	c
chimp	a	g	a	g	t	c
gorilla	c	g	g	c	a	g
orangutan	c	g	g	g	a	c

Put sites 1 and 3 together

	1	2	3	4	5	6
human	a	g	t	c	t	c
chimp	a	g	a	g	t	c
gorilla	c	g	g	c	a	g
orangutan	c	g	g	g	a	c

Now put all of them together

	1	2	3	4	5	6
human	a	g	t	c	t	c
chimp	a	g	a	g	t	c
gorilla	c	g	g	c	a	g
orangutan	c	g	g	g	a	c

Which tree is the most parsimonious?

The parsimony algorithm

- 1) *Construct all possible trees*
- 2) *For each site in the alignment and for each tree count the minimal number of changes required*
- 3) *Add all sites up to obtain the total number of changes for each tree*
- 4) *Pick the tree with the lowest score*

The parsimony algorithm

Too many!

- 1) *Construct all possible trees*
- 2) *For each site in the alignment and for each tree count the minimal number of changes required*
- 3) *Add all sites up to obtain the total number of changes for each tree*
- 4) *Pick the tree with the lowest score*

The parsimony algorithm

1) *Construct all possible trees*

Too many!

2) *For each site in the alignment and for each tree count the minimal number of changes required*

How?

3) *Add all sites up to obtain the total number of changes for each tree*

4) *Pick the tree with the lowest score*

The parsimony algorithm

1) *Construct all possible trees*

Too many!

Search
algorithm

2) *For each site in the alignment and for each tree count the minimal number of changes required*

How?

Fitch's algorithm

3) *Add all sites up to obtain the total number of changes for each tree*

4) *Pick the tree with the lowest score*
